Introduction

This is the fifth of several reports to be released by the Summit County Public Health Population Health Division’s Vital Statistics Brief report series. These reports will provide the citizens of Summit County with regular updates on several key topics related to health and health outcomes. Additional volumes in the series will also be released from time to time, updating the community on other topics of interest.

For those interested in obtaining detailed data and statistics, please visit our website, https://www.scph.org/assessments-reports. There, visitors can access our interactive Data Dashboards, which allows users to design customized graphics and tables for their own use.

Age-Adjusted Suicide Rates in Summit County

Age-adjusted suicide rates in Summit County was just above the national average, 14.4 per 100,000 in 2020 (the last year that comparable data was available). Suicide rates rose steadily between 2010 and 2015, then began trending downward from it’s 2015 peak of 17.6 per 100,000. Suicide rates also rose for the nation as a whole, peaking at 14.8 per 100,000 in 2018.\(^1\)

Despite the recent declines, age-adjusted suicide rates were 47% higher in 2020 than they were in 2007. The national rate only rose by 19% between those same years.

*Figure 2: Ten Leading Causes of Death Ranked For 10 Different Age Groups*  
*Source: ODH Death Certificate Data, Centers for Disease Control and Prevention*

The table above, originally published in the *Death and Life Expectancy* data brief, is based on a format originally designed by the CDC. It shows the top 10 leading causes of death for each of 10 age groups for people in Summit County. Some of the more common causes of death are color-coded so that readers can follow the progression of that disease throughout the age spectrum. Suicide rates are the second, third, and fourth-leading causes of death in earlier years (ages 15-44), then drops to 10th place for those age 55-64, and out of the top 10 causes altogether for older adults.
Trends in attempted suicides -- About 7.2 Summit County residents visit an emergency room (ER) per day to be treated for a suicide-related visit between 2017 and 2022 to date. ER visits for suicide-related reasons peaked at 9.7 per day in mid-May 2018, and currently stand at 7.2 per 100,000. Most visits to the ER for suicide attempts are by Whites (87%), males (53%) and those age 18-64. The average age for all suicide-related ER visits is 37.1 years.

Figure 3a (age), 3b (sex), 3c (race): Suicide-related visits to an ER, 2017-2022. Source: EpiCenter

There is no way to determine the ultimate outcome of those who visit the ER because of a suicide attempt based on available ER data. However, based on data analyzed by the American Association of Suicidology, only about one out of every 25 suicide attempts is successful. If this estimate is accurate, it’s possible that many of those who end up in the ER because of a suicide attempt may have survived it.

Figure 4: 30-Day Moving Average of Visits to the ER for Any Suicide-Related Reason, Summit Co. 2017-22 YTD. Source: EpiCenter

Figure 5: Total ER visits, Summit Co. 2017-22 YTD. Source: EpiCenter

3 Total visits ER visits dropped by 21% in Spring 2020 due to COVID-19. Suicide-related visits dropped at the same time and have remained lower since then. Therefore, this data should be viewed with caution, as there is no way to know for sure how suicide-related visits may have been impacted by COVID-19.

4 There is no way to determine the ultimate outcome of those who visit the ER because of a suicide attempt based on available ER data. However, based on data analyzed by the American Association of Suicidology, only about one out of every 25 suicide attempts is successful. If this estimate is accurate, it's possible that many of those who end up in the ER because of a suicide attempt may have survived it.
Demographic Differences In Suicide Rates

Age -- More than two-thirds of all suicides occur before age 55 (68%). Suicides are rare in the under age 18 population, accounting for 4% of all suicide deaths between 2000 and 2021. Suicides increase by age group until peaking in the 45-54 age group, which alone accounts for more than 22% of all suicide deaths. About 32% of all suicide deaths take place among those ages 55 and higher.

Race / Ethnicity -- The vast majority of people who committed suicide between 2007 and 2021 were white (89%), while 8% of suicides were African-American and 3% were members of another race. Comparisons to the nation as a whole show that Summit County is more or less in line with national trends. Less than 1% of suicide deaths were identified as Hispanic.
**Gender** -- Males make up an overwhelming majority of suicide deaths, 79% vs. 21% for females. This is also true nationally, and has been consistent since at least 2007 in Summit County.

![Figure 7: Percent of Suicides By Sex, Summit County, 2007-2021](source)

**Gender and Means** -- According to the Centers for Disease Control and Prevention, females are more likely than males to have suicidal thoughts and to attempt suicide. However, as shown above, males are four times more likely to successfully take their own lives than females. One reason is the preferred means of suicide for each gender (see Figure 6). Males are more likely to use a firearm than females, while females are more likely to intentionally overdose on drugs than males. The fact that firearms are both far more lethal and kill more quickly than drug overdoses is a major contributing factor to the higher death rate among males. Data presented in Figure 6 show that males are twice as likely as females to use a firearm in their suicide attempt, while females were 6 times more likely to resort to intentional poisoning (most often drug poisoning) than males. Males and females were about equally likely to use a means other than firearms or drug overdoses.

![Figure 8: Suicide by Gender and Means of Suicide in Summit County, 2007-2021](source)

---

**Educational Attainment** -- Nearly two-thirds of all suicide deaths are among people with less than a 4-year degree. Of that group, those with only a high school diploma or GED were the most likely to commit suicide (49%), followed by those with a 9th grade-12th grade education (without a diploma or GED) and those with some college. Together, these three categories accounted for 83% of all suicides. Males made up the vast majority of suicides across all educational categories.

![Figure 9: Percent of Suicides By Educational Attainment and Sex, Summit County, 2007-2021](total for all categories = 100%)

Source: Ohio Department of Health (ODH) Death Certificate Data, Centers for Disease Control and Prevention

**Marital Status** -- The marital status of suicide victims is very different from the population as a whole. Those who commit suicide are significantly more likely to be divorced, more likely to be single (never married), and significantly less likely to be married, than Summit County residents age 15 and over.

Geography -- Suicide rates per 100,000 people are highest in the Akron North, Barberton, and Akron South clusters. The county’s lowest suicide rates can be found in the Hudson and Richfield / Boston, Twinsburg, and Stow / Silver Lake clusters.

Risk and Protective Factors for Suicide

The Centers for Disease Control and Prevention (CDC) have identified several risk and protective factors that help identify situations in people’s lives that make suicide more likely (risk factors) or less likely (protective factors). These factors, taken from the CDC’s Violence Prevention website, are listed below:

<table>
<thead>
<tr>
<th>Risk Factors</th>
<th>Protective Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>A combination of individual, relationship, community, and societal factors contribute to the risk of suicide. Risk factors are those characteristics associated with suicide—they might not be direct causes.</td>
<td>Protective factors buffer individuals from suicidal thoughts and behavior. To date, protective factors have not been studied as extensively or rigorously as risk factors. Identifying and understanding protective factors are, however, equally as important as researching risk factors.</td>
</tr>
<tr>
<td>• Family history of suicide</td>
<td>• Effective clinical care for mental, physical, and substance abuse disorders</td>
</tr>
<tr>
<td>• Family history of child maltreatment</td>
<td>• Easy access to a variety of clinical interventions and support for help seeking</td>
</tr>
<tr>
<td>• Previous suicide attempt(s)</td>
<td>• Family and community support (connectedness)</td>
</tr>
<tr>
<td>• History of mental disorders, particularly clinical depression</td>
<td>• Support from ongoing medical and mental health care relationships</td>
</tr>
<tr>
<td>• History of alcohol and substance abuse</td>
<td>• Skills in problem solving, conflict resolution, and nonviolent ways of handling disputes</td>
</tr>
<tr>
<td>• Feelings of hopelessness</td>
<td>• Cultural and religious beliefs that discourage suicide and support instincts for self-preservation</td>
</tr>
<tr>
<td>• Impulsive or aggressive tendencies</td>
<td></td>
</tr>
<tr>
<td>• Cultural and religious beliefs (e.g., belief that suicide is noble resolution of a personal dilemma)</td>
<td></td>
</tr>
<tr>
<td>• Local epidemics of suicide</td>
<td></td>
</tr>
<tr>
<td>• Isolation, a feeling of being cut off from other people</td>
<td></td>
</tr>
<tr>
<td>• Barriers to accessing mental health treatment</td>
<td></td>
</tr>
<tr>
<td>• Loss (relational, social, work, or financial)</td>
<td></td>
</tr>
<tr>
<td>• Physical illness</td>
<td></td>
</tr>
<tr>
<td>• Easy access to lethal methods</td>
<td></td>
</tr>
<tr>
<td>• Unwillingness to seek help because of the stigma attached to mental health and substance abuse disorders or to suicidal thoughts</td>
<td></td>
</tr>
</tbody>
</table>

The Campaign to Change Direction is a collection of concerned citizens, nonprofit leaders, as well as leaders from the private and public sectors who have come together to change the culture about mental health, mental illness, and wellness.

Know the Five Signs

Know the signs that someone may be struggling with their mental health:

- Not Feeling Like Us?
- Ru Agitated?
- Ru Withdrawn?
- Feeling Hopeless?
- Caring & Us?

Show compassion and caring and a willingness to find a solution when the person may not have the will or drive to do it alone. There are many resources in our communities.

If everyone is more open and honest about our emotional health and well-being, we can prevent pain and suffering, and those in need will get the help they deserve.

Make a Pledge to share the signs.
